This present sequence represents the hyaluronate synthase (pmHAS)

of Pasteurella multocida Carter Type A. The pmHAS enzyme has

different kinetic optima with respect to pH and metal ion

dependence, and different Km values compared with the HAS enzymes

of Streptococcus equisimilis (see AAV06206) and Streptococcus

pyogenes. Km values are about 2- to 3-fold lower for UDP sugars,

on Vmax values are about 2- to 3-fold higher. The invention

provides recombinant vectors containing hyaluronate synthase DNA,

capecially S. equisimilis hyaluronate synthase DNA,

capecially S. equisimilis hyaluronate synthase DNA,

cand prokaryotic or eukaryotic host cells which produce the enzyme

and its hyaluronic acid product, particularly, a product with

modified structure or molecular size. The hyaluronic acid produced

this way is purer than that produced by conventional methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      594 TDGFNENIENAVDYDMFLKLSEVGKFKHLNKICYNRVLHGDNTSIKKLGIQKKNHFVVVN 653

This is the Pasturella multocida hyaluronate synthase (PmHAS) amino acid sequence. Hyaluronic acid (HA) or hyaluronan, is a polysaccharide that serves both structural and recognition roles in higher animals. Bacteria produce extracellular capsules of HA which mimic their host HA and aid escape from a host immune response. The invention includes a vector containing the PmHAS nucleotide sequence which can be used to express PmHAS in a foreign host. The HS nucleic acids can be used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vaccines

production of HA. Also, specific changes to the HS coding sequence can result in the production of HA having a modified size distribution or structural configuration and functional properties. The HA products can be used in e.g. drug delivery, angiogenesis and wound healing, stabilisation of recombinant proteins and in cosmetics. The HS nucleic pacids can also be used to develop agents to block capsule synthesis by pathogens and act as antibiotics. The avirulent P. multocida strains can be used as vaccines for fowl cholera or shipping fever.

This sequence encompasses residues 1 to 703 of the 972 residues of the native PuRAS-D. This sequence encompasses catalyses glycosaminoglycan polymerisation to produce hyaluronic acid, catalyses glycosaminoglycan polymerisation to produce hyaluronic acid, at useful for a number of applications. HA can be used during ophthalmic surgery as a viscoelastic replacement for the vitreous humour e.g. during laplantation of intraocular lenses in cataract patients. HA injections directly into joints is also used to alleviate pain associated with a cathritis. HA can also be used to coat medical devices e.g. catheters and sensors to reduce tissue abrasion. HA can also be used as bloadhesives for haemostatic sealing and healing of wounds and surgical indislons; and surginal indislons; and wounds, ulcers, injuries or surgined delivery of encapsulated cuns, therefore be used to produce HA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel method for the enzymatic transfer of sugar molecules to an acceptor, useful for synthesis of e.g. polysaccharide bioadhesives or drug delivery systems, including hybrid molecules

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     6
                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the genome sequence of Listeria monocytogenes ECD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are genes themselves and the encoded proteins. The prokaryotes used are cascherichia coli, Staphylococcus aucus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The commention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen corrections on the used to screen compounds in rational drug discovery programmes uncleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

On the printed specification, but was obtained in electronic format directly from WIPO at the printed probablished_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25;

The invention relates to antisense inhibitors of genes essential to prokaryotic callular proliferation, their use in identifying the genes, their use in the discovery of novel antiborics, the essential comes, their use in the discovery of novel antiborics, the essential comes, their use in the discovery of novel antiborics, the essential comes are themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aud Enterococcus facellis. The neumoniae, Pseudomonas acrudinosa and Enterococcus facellis. The contention is also useful for the identification of potential new targets for antibotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery corporammes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic callular proliferation protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenese (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect Streptococcus in a biological sample. (I) is used to detect determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be used in gene therapy. Antiboddes to (I) are used for affinity chromogoraphy, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                            Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.

P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial

                                                                Streptococcus suis serotype 1. The genes in this cluster are involved in polysaccharide biosynthesis of capsular components and antigens. The proteins have glycosyltransferase activities (CpsIE, CpsIG, CpsII, CpsII, and CP polymerase activities (CpsII). The capsule confers deacterium resistance to complement-mediated opsonophagocytosis. The gene cluster is used as a source of probes and primers for scrotype-specific detection of S. suis and is also useful for recombinant production of the proteins. The proteins are then useful for producing antigens that can be used in vaccines, for controlling or eradicating a Streptococcal disease, in humans or animals, e.g. against S. suis in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            VSIFYPNTLNGLVKKLNNIIEXN--KNIFVIILHVDKNHLT--PDIK-KEILAFYHKHQV 762

                                                                                                                                                                                                                                                                                                                                                                                                        A chromosomal DNA sequence representing practically the whole eps (exopolysaccharide biosynthesis) operon from Streptococcus thermophilus strain Sf16 (deposited as CNCM r-1590) was isolated. The sequence contained 14 open reading frames, one of which was located on the complementary strand. The present sequence is decoded from the epsH open reading frame. The EpsH protein is probably a glycosyl transferase.

Novel exopolysaccharides can be produced by transforming lactic acid bacteria which produce exopolysaccharides with DNA encoding at least one enzyme from the eps operon. The new exopolysaccharides are useful for thickehing drinks, liquid desserts, yoghurts, soups, ice-creams, coffee creams, sauces, mayonnaise, etc.

Streptococcus thermophilus exopolysaccharide (EPS) synthesis operon. The operon has 13 oper reading frames (ORF) designated eps^A M encoding proteins AAW22169-81. This protein has 24% identity to a protein encoded by the RfbV ORF of the rfb cluster from Salmonella typhimurium and is probably a glycosyl transferase. The EPS are useful for thickening e.g. drinks, liquid desserts, yoghurts, soups, ice-creams, coffee creams, sauces, mayonnaise.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         represents the protein encoded by the epsI gene from the

```

```
AAY54075-85 represent enzymes involved in the biosynthesis of
exopolysaccharides (EPS). These enzymes are designated EPS1-EPS11 and
care encoded by open reading frames eps1-eps11. The enzymes are isolated
from Lactobacillus helveticus strain LH59. The proteins are used
from Lactobacillus helveticus strain LH59. The proteins are used
in a method for the synthesis of EPS, which includes at least one step
of forming a bond (alpha or beta isomer) between C-1 (carryning the
cof forming a bond (alpha or beta isomer) between C-1 (carryning the
cof EPS cocurs with, in each step, addition of a new sugar unit, through
cof EPS occurs with, in each step, addition of a new sugar unit, through
cof IEPS occurs with, in each step, addition of a new sugar unit, through
cof its hemi-acetyl function, to an alcoholic hydroxyl of a second sugar
cof int, present at the end of a chain of sugar residues bonded to the
primer. EPS1 has homology with an undecaprenyl-phosphate-girosyl-1-
phosphate-transferase; EPS2, EPS3 and EPS4 are alpha-
cylvcosyltransferase; EPS5 and EPS6 have homology with a beta-
glycosyltransferase; EPS9 and EPS6 have homology with a beta-
cylvcosyltransferase; EPS9 and EPS6 have homology with a beta-
glycosyltransferase; EPS9 and EPS6 have popolymerase;
conto the following repetitive unit; EPS10 transports the polysaccharides
conto the following repetitive unit; EPS10 transports the polysaccharides
conto the EPS enzyme are used to improve properties of formed
particularly fermented milk products such as yoghurt and cheese,
ceg. their organoleptic properties and flavour stability.

Patent No. US2002005516841
GENERAL INFORMATION:
APPLICANT: Smith, Hilda
TITLE OF INVENTION: STREPTOCOCCUS SUIS VAC;
FILE REFERENCE: 2183.4726
CURRENT APPLICATION NUMBER: US/09/767,041
CURRENT FILING DATE: 2001-01-22
PRIOR APPLICATION NUMBER: EP98202465.5
PRIOR FILING DATE: 1999-07-19
PRIOR FILING DATE: 1998-07-22
PRIOR FILING DATE: 1998-07-22
NUMBER OF SEQ ID NOS: 53
SOFTWARE: Patentin version 3.0
SSOFTWARE: Patentin version 3.0
                                TYPE: amino acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: protein
SEQUENCE DESCRIPTION: SEQ ID NO: 200:

Patent No. US20020042369A1

GENERAL INFORMATION:

APPLICANT: Glibert, Michel

APPLICANT: National Research Council of Canada

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Campylobacter Glycosyltransferases

CURRENT PRILING DATE: 2001-03-21

PRIOR APPLICATION NUMBER: US 60/118,213

PRIOR FILING DATE: 1999-02-01

PRIOR FILING DATE: 2000-01-31

NUMBER OF SEQ ID NOS: 49
